

They Think They're Invincible... ...You Know They're Not.

Routine Immunizations for Adolescents *At-a-Glance*

Recommended Vaccine

- Meningococcal *
- HPV
- Tdap
- Influenza

Prevents

Meningococcal disease, a cause of meningitis and blood infections

HPV-related diseases, including cervical and anal cancer

Tetanus, diphtheria, and pertussis or whooping cough, which is on the rise

The flu, which can be serious or deadly every year for even healthy adolescents

Ideally, children should receive these vaccines at 11-12 years-old. If your child missed a vaccination at this age, it's not too late.

*A booster dose is recommended at age 16. For those who receive the first dose at 13-15 years, a booster is recommended at 16-18 years. CDC suggests that adolescents receive the vaccine less than five years before starting college.

Multiple vaccinations can be given in the same doctor or clinic visit.
Talk to your child's healthcare provider to learn more.
